

Steel Erection

Controlling Related Hazards

References

- ◆ EM 385-1-1 Section 27
- ◆ 29 CFR 1926.750 ; Subpart R
- ◆ NFGS 1525 (Latest)
- ◆ Manufacturer's Material
- ◆ Accident Abstracts

Potential Contractor Mishap Outcomes

- ◆ Falls off of structural steel
- ◆ Struck by falling objects, tools, bolts etc.
- ◆ Structural steel collapse
- ◆ Struck by suspended steel.
- ◆ Riveting related fires.
- ◆ **Leading to property damage, injury, death**

Direct Causes of Steel Erection Related Mishaps

- ◆ Working without fall protection.
- ◆ Not guying or bracing vertical structures.
- ◆ No temporary floor
- ◆ Working near fall hazard without training.
- ◆ Improper selection, use and maintenance of fall protection systems.
- ◆ Unsafe work practices.

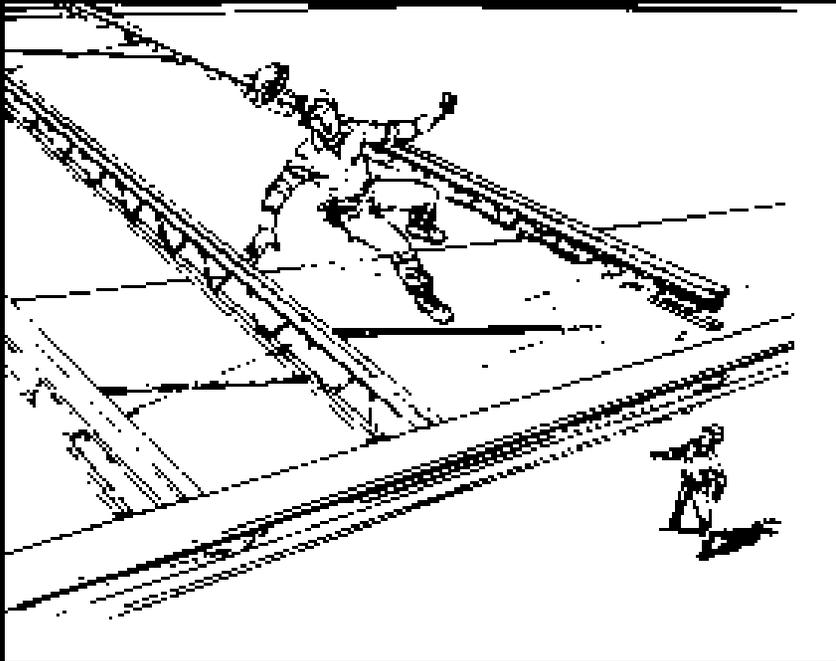

Indirect Causes of Steel Erection Related Mishaps

- ◆ Lack of fall protection training.
- ◆ No SOP for operation.
- ◆ Lack of fall safety supervision.
- ◆ Failure to apply AHA by site superintendent.
- ◆ Inadequate site-specific safety training prior to phase of work.

Indirect Causes of Steel Erection Related Mishaps (continued)

- ◆ Approved safety plan not implemented.
- ◆ Proper equipment, materials & protective system not provided.
- ◆ Daily inspections of protective systems and surrounding area not performed.
- ◆ Lack of management leadership.

Fatal Mishap

- ◆ Worker connecting X bracing.
- ◆ Only one end of bar joist he was was welded.
- ◆ Worker was sitting on unwelded end.
- ◆ He dislodged the joist and fell 24 feet.
- ◆ No fall protection.
- ◆ What would have prevented this incident ?

Controlling Steel Erection Related Hazards

Contractors must use various methods to protect their workers from the hazards associated with working on roofs. These include: Following EM-385 Section 27, Most recent Guide Specifications, and Safety Plan/AHA. Contractor review of associated Accident Abstracts also helpful !

Material and Equipment

- ◆ Impact wrenches must have means to retain socket.
- ◆ Containers must be used for pins, bolts, and rivets to prevent dropping on workers.
- ◆ Safety wire must be used on the snap and handle of pneumatic riveting hammer.

Guying and Supporting Vertical Structures

- ◆ Applies to structural steel and reinforcing steel for walls, piers, columns.
- ◆ Vertical structures must be guyed and supported.
- ◆ Guying/supporting designed to prevent collapse.

Hoisting Line Load Release

- ◆ During final placement of solid web steel.
- ◆ Load must not be removed from hoisting line until members are secured.
- ◆ Members must have at least two bolts or 10% of the bolts, whichever is greater at each connection..
- ◆ Bolts must be wrench tight.

X-Mas Treeing

- ◆ This practice is not permitted.
- ◆ Although OSHA permits EM 385 does not.

Open Web Steel Joists

- ◆ Must not be placed on structural steel unless framework is permanently bolted.
- ◆ No load placed on steel joists until bridging is complete and permanent.
- ◆ Hoisting cables must not be removed from joist until enough top and bottom chord bridging is attached for lateral restraint.

Lateral Bracing

- ◆ Needed when bar joist and columns are not framed in at least two directions.
- ◆ A bar joist must be field bolted at columns to provide lateral stability.
- ◆ Joists or trusses 40 feet or longer must have an installed center row of bolted bridging before slacking hoisting line.
- ◆ No loads placed on open web joists until 2 bolts or 10% whichever is greater at all connections.

Riveting, Bolts, and Pins

- ◆ Riveting should not be done near combustibles.
- ◆ Fire prevention precautions necessary if combustibles are present.
- ◆ When bolts, drift pins, and rivets are being knocked out, they must be kept from falling.

Fall Protection

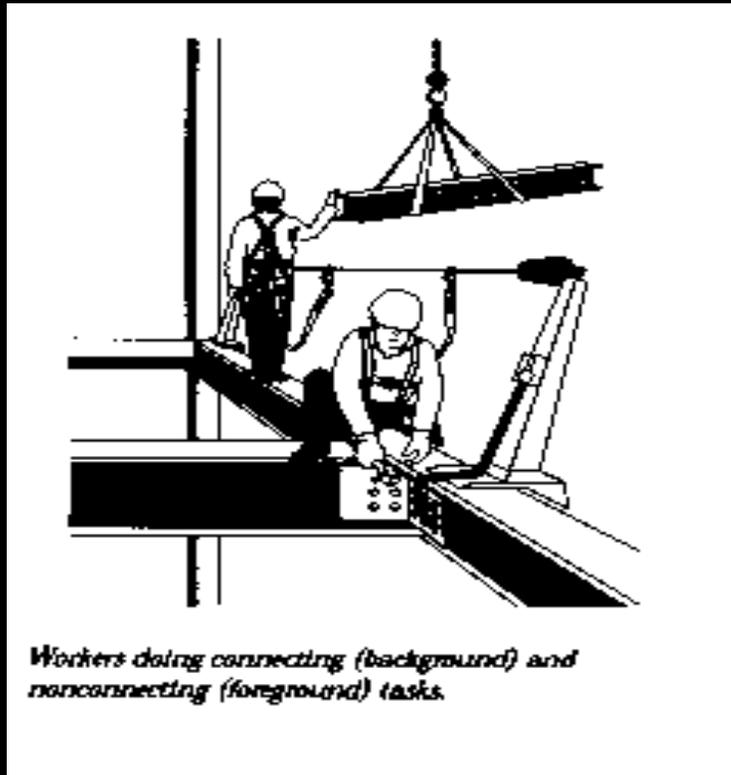

- ◆ Must be provided.
- ◆ Whenever workers are exposed to a fall of 6 feet or greater.
- ◆ Section 21 of EM-385-1-1 applies.
- ◆ Note: OSHA does not hold contractors to 6 foot rule during erection activities, EM 385 is more stringent !

Limiting Fall Hazard Exposure

- ◆ One way to limit exposure is to use elevating devices.
- ◆ Less time is spent on the iron.
- ◆ Must ensure workers never tie-off to the structure.
- ◆ Fall protection required ?

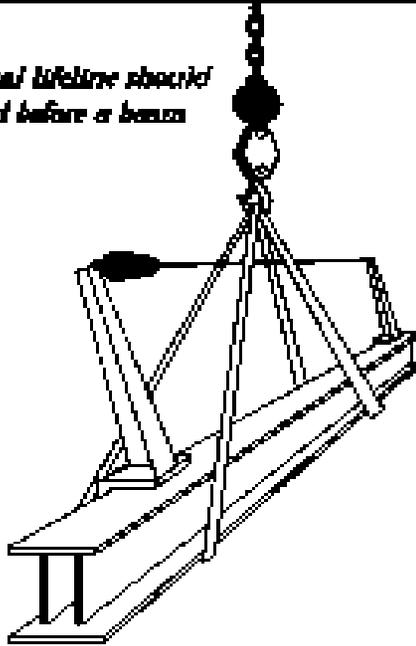

Protected Workers

- ◆ Two workers doing two different jobs.
- ◆ Both protected from the fall hazard.
- ◆ This is an ideal situation.

Horizontal Life Lines

A horizontal lifeline should be installed before a beam is placed.

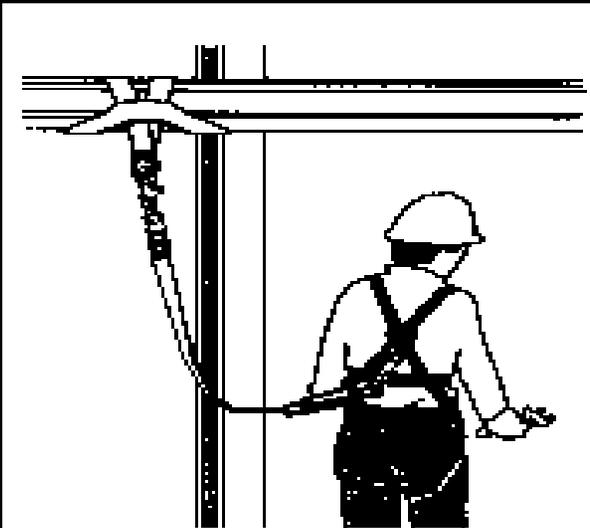

- ◆ There are many manufactured horizontal life line systems on the market.
- ◆ It is best to install them on the ground.

Horizontal Lifeline

- ◆ This worker is using a horizontal lifeline.
- ◆ Remember horizontal lifelines require careful design.
- ◆ Must be designed, installed and used under the direction of a qualified person.

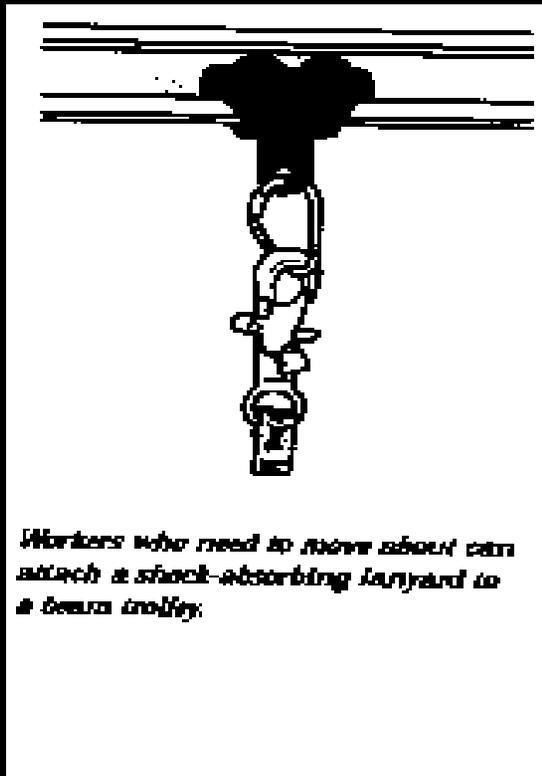

Stationary Anchor Point

If a worker doesn't need to move from the work area, he or she can attach a shock-absorbing lanyard to an overhead beam with a tie-off adaptor.

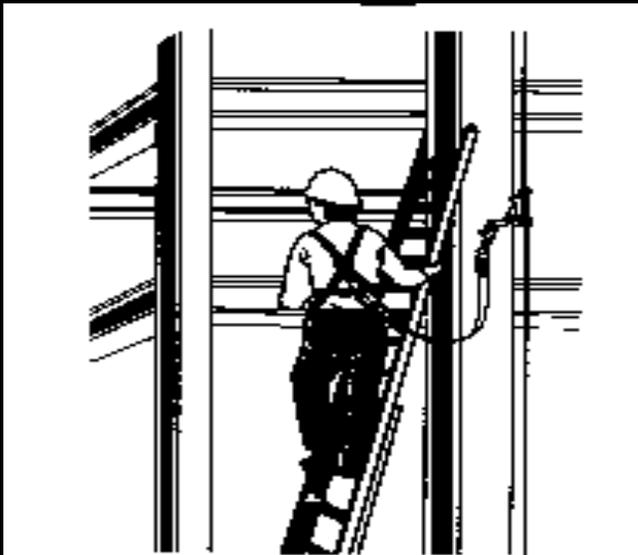

- ◆ This worker is using a cross arm strap.
- ◆ This anchor point is in a good position above the worker.
- ◆ Workers should not wrap their lanyard directly around steel.

Mobile Anchor Points

- ◆ Often mobility is necessary.
- ◆ This anchor point rides along the beam.
- ◆ Often referred to as a beam trolley.

Vertical Life Line and Column

This worker is attached to a vertical lifeline with a lanyard and rope grab. The lifeline was anchored to the top of the column while it was on the ground.

- ◆ Best to attach lifeline to top of column while still on the ground.
- ◆ This affords protection from the ground up.
- ◆ Retractable can also be installed at top of column while on ground.

Temporary Flooring

- ◆ Derrick or erection floors must be fully planked or decked over (except for access)
- ◆ Maintained with two stories or 30 feet (whichever is less) of workers.
- ◆ If temporary floor is not possible and personnel lifting platforms or scaffolds are not used, then safety nets required when fall distance exceeds two stories or 25 feet.

Temporary Flooring Con't

- ◆ Design of temporary flooring must be approved by a registered engineer.
- ◆ Planking/decking must be strong enough to carry working load.
- ◆ Planking at least full 2 inches thick.
- ◆ Laid tight and secured.
- ◆ Placing and moving temporary flooring under a fall protection systems outlined in AHA accepted by designated authority.

Perimeter Safety Line

- ◆ After temporary floor, a perimeter safety line is required.
- ◆ Must be 1/2 inch wire rope.
- ◆ Approximately 42 inches above deck.
- ◆ Attached to all perimeter columns, taught and flagged.
- ◆ Must remain place until walls are installed.

Perimeter Safety Line Construction

Correct method: U-bolts on short end of rope. (No distortion on live end of rope.)

Wrong method: U-bolts on live end of rope. (This will cause marked spots on live end of rope.)

Wrong method: Staggered clips. (This will cause a marked spot in live end of rope due to wrong position of center clip.)

How to use wire-rope U-bolt clips

- ◆ Often the weakest link is the U-bolt application.
- ◆ Proper size, number and method of application is crucial.
- ◆ Top example is correct.

Permanent Flooring

- ◆ Installed as erection members progress.
- ◆ No more than eight stories between erection floor and last permanent floor.
- ◆ No more than two floors of unfinished bolting or welding above foundation of uppermost permanent floor.
- ◆ More than two floors only if column is continuous and approved by designated authority: in no case, no more than 4 floors.

Good, Bad or Ugly ?

- ◆ What's good about this work area ?
- ◆ What's bad about this operation ?
- ◆ Is this worker protected ?

**During a site visit you see this.
Is there a problem ?**
